

The project builds a web content conversion system for multiple channels. That does not only include desktop web browser, mobile devices like PDA or mobile phones, but also voice devices like ordinary telephone. It can even let PDA read the extracted content and capture human voice input to navigate the converted web site. Three web sites are processed for demonstration: OGCIO's web site, Digital 21, and InfoSec web site.

Note: This project is a collaboration of PITECH and Kanhan Technology Limited. PITECH is responsible for the PDA application and online content extraction.
